

# VT/SVT Discrimination Algorithm Session

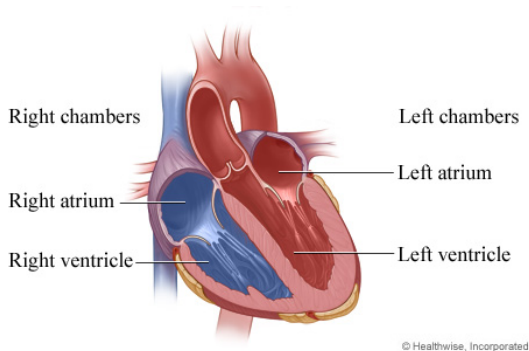

## Temporal Logic approach

TU Wien    UPenn

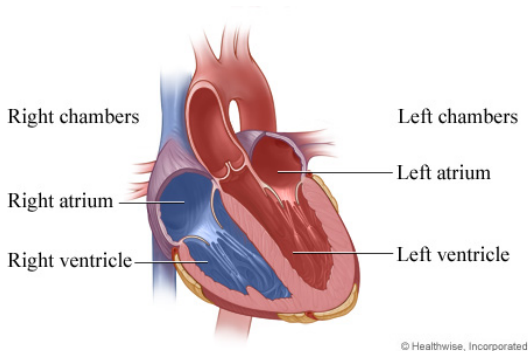

Speakers:    Alena Rodionova  
                 Radu Grosu  
                 Houssam Abbas

CyberCardia Project Meeting  
April 22-23, 2016

# Cardiac Preliminaries. Anatomy

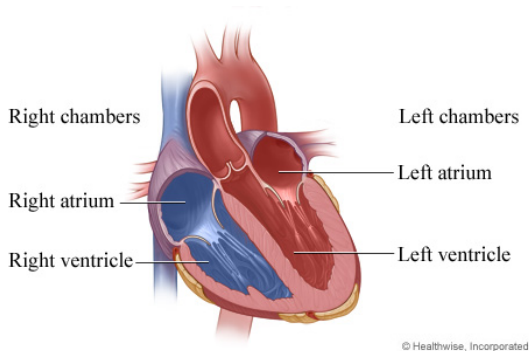

# Cardiac Preliminaries. Anatomy

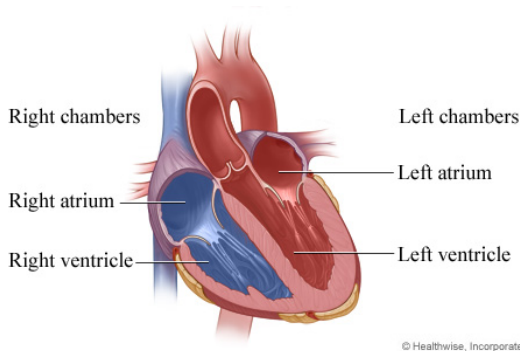

- 4 chambers: 2 atria and 2 ventricles

# Cardiac Preliminaries. Anatomy

- 4 chambers: 2 atria and 2 ventricles
- Average heart size: 12x10x8 cm, weight: 300 g

# Cardiac Preliminaries. Anatomy

- 4 chambers: 2 atria and 2 ventricles
- Average heart size: 12x10x8 cm, weight: 300 g
- It pumps 70 ml of blood each heart beat = 5 litres in one minute (in a big stress:  $\leq 200$  ml,  $\leq 40$  litres)

# Cardiac Preliminaries. Conductivity

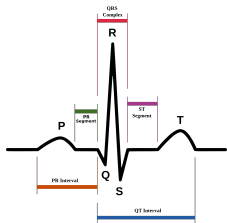

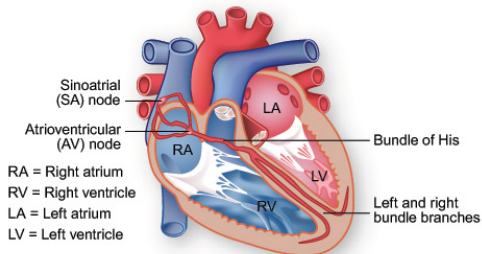

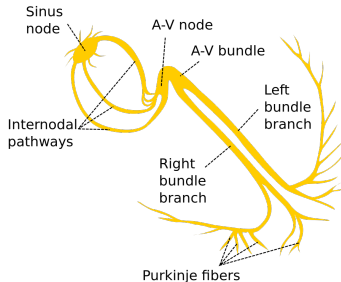

Figure: Electrical impulse propagation

## Cardiac Preliminaries. Arrhythmia

- ☞ abnormal heart beats
- ☞ any change from the normal sequence of electrical impulses

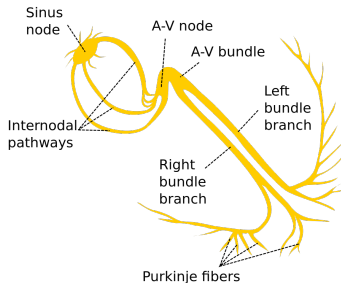

# Cardiac Preliminaries. Arrhythmia

- ☞ abnormal heart beats
- ☞ any change from the normal sequence of electrical impulses

# Cardiac Preliminaries. Arrhythmia

- 👉 abnormal heart beats
- 👉 any change from the normal sequence of electrical impulses

## *Causes:*

- The heart's natural pacemaker (SA) develops an abnormal rhythm.
- The normal conduction pathway is interrupted.
- Another part of the heart takes over as pacemaker.

# Cardiac Preliminaries. Tachycardia

Types of tachycardia:

# Cardiac Preliminaries. Tachycardia

Types of tachycardia:

- *Supraventricular tachycardia (SVT)* begins in the upper portion of the heart, the atria

# Cardiac Preliminaries. Tachycardia

Types of tachycardia:

- *Supraventricular tachycardia (SVT)* begins in the upper portion of the heart, the atria
  - Sinus Tachycardia

# Cardiac Preliminaries. Tachycardia

Types of tachycardia:

- *Supraventricular tachycardia (SVT)* begins in the upper portion of the heart, the atria
  - Sinus Tachycardia
  - Paroxysmal Supraventricular Tachycardia

# Cardiac Preliminaries. Tachycardia

Types of tachycardia:

- *Supraventricular tachycardia (SVT)* begins in the upper portion of the heart, the atria
  - Sinus Tachycardia
  - Paroxysmal Supraventricular Tachycardia
  - Wolff-Parkinson-White Syndrome

# Cardiac Preliminaries. Tachycardia

Types of tachycardia:

- *Supraventricular tachycardia (SVT)* begins in the upper portion of the heart, the atria
  - Sinus Tachycardia
  - Paroxysmal Supraventricular Tachycardia
  - Wolff-Parkinson-White Syndrome
  - Atrial Fibrillation (AFib)

# Cardiac Preliminaries. Tachycardia

Types of tachycardia:

- *Supraventricular tachycardia (SVT)* begins in the upper portion of the heart, the atria
  - Sinus Tachycardia
  - Paroxysmal Supraventricular Tachycardia
  - Wolff-Parkinson-White Syndrome
  - Atrial Fibrillation (AFib)
  
- *Ventricular tachycardia (VT)* begins in the heart's lower chambers, the ventricles
  - Premature Ventricular Contractions
  - Ventricular Fibrillation
  - Ventricular Flutter

EGM signal: Atrium lead

## Cardiac Preliminaries. Inappropriate shocking

Up to 40% of patients experience inappropriate therapy during long-term follow-up\*.

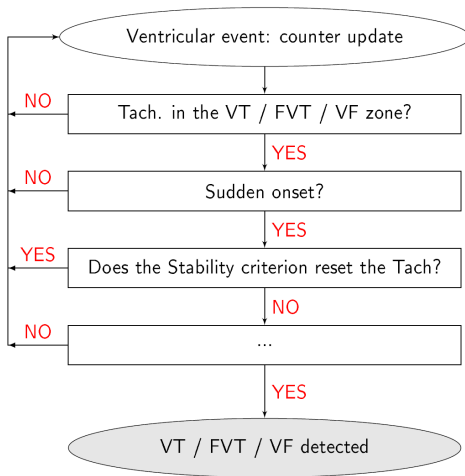

- Pain
- Anxiety
- Anger
- Stress
- Depression
- Fear  $\implies$  poor quality of life

## Discrimination as a Logical Formula

We propose to formulate the VT/SVT discrimination problem as a *Runtime Verification* problem:

$$\mathcal{M} \models \Phi$$

## Discrimination as a Logical Formula

We propose to formulate the VT/SVT discrimination problem as a *Runtime Verification* problem:

$$\mathcal{M} \models \Phi$$

- Express desired operations as a logical formula  $\Phi$ .
- During runtime, monitor whether the heart's electrical activity satisfies the formula.

# Discrimination as a Logical Formula

We propose to formulate the VT/SVT discrimination problem as a *Runtime Verification* problem:

$$\mathcal{M} \models \Phi$$

- Express desired operations as a logical formula  $\Phi$ .
- During runtime, monitor whether the heart's electrical activity satisfies the formula.

Advantages:

- Parameters synthesis (e.g., Better thresholds set)
- Automatic monitors synthesis
- Combined approach: Sensing + Discrimination
- $\implies$  Better performance

# LTL: Linear Temporal Logic [6]

## ► *LTL Syntax*

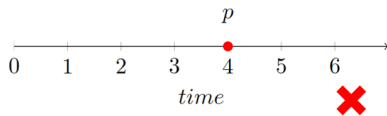

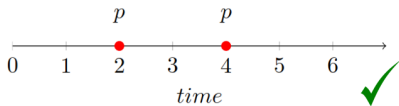

$$\Phi = \{p \mid \neg\varphi \mid \varphi \vee \psi \mid \bigcirc\varphi \mid \varphi \mathcal{U}\psi\}$$

- $\varphi \wedge \psi = \neg(\neg\varphi \vee \neg\psi)$
- Finally operator:  $\Diamond\varphi = \top \mathcal{U}_I \varphi$
- Globally operator:  $\Box\varphi = \neg \Diamond_I \neg\varphi$

# LTL: Linear Temporal Logic [6]

Example.

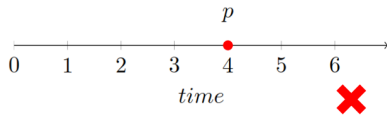

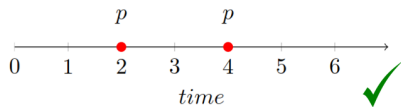

$$(x, 1) \models \bigcirc p$$

# LTL: Linear Temporal Logic [6]

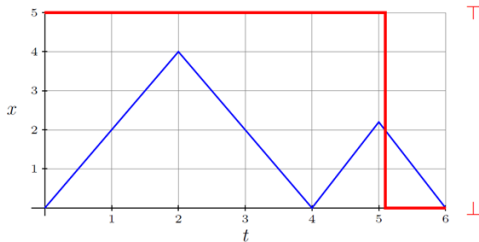

Example.

$$(x, 1) \models \bigcirc p$$

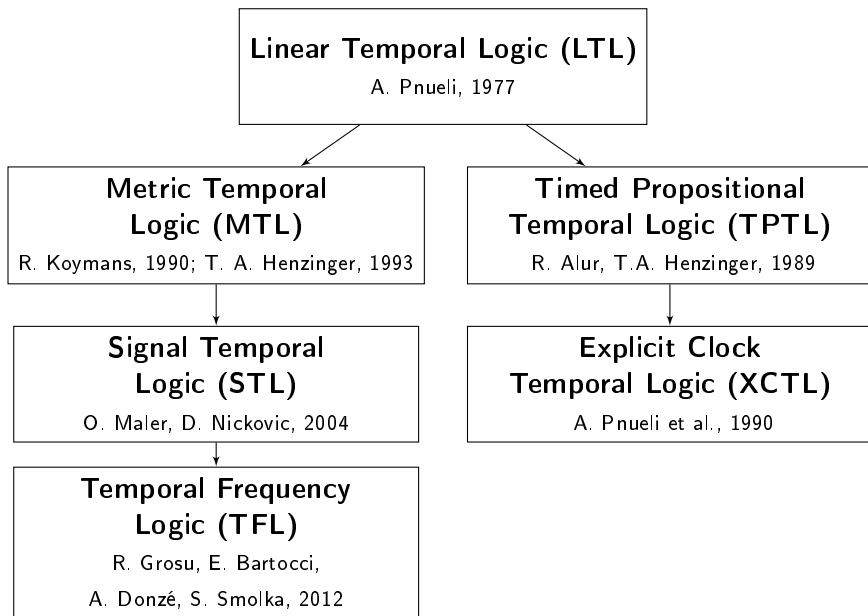

Example.

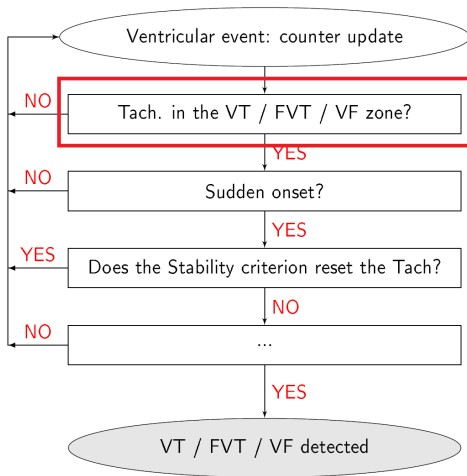

$$\varphi = \Diamond(x \geq 2)$$

# Families of Temporal Logics

# Tachycardia zones

- Is Tachycardia in the VT, FVT or VF zone?
- How to specify it in a logical formula  $\varphi$ , such that  $\mathcal{M} \models \varphi$ ?

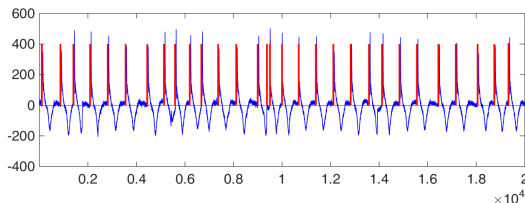

# 1. Is Tachycardia in the VT, FVT or VF zone?

► Assume we are given a Boolean signal  $x$ :

# 1. Is Tachycardia in the VT, FVT or VF zone?

- Assume we are given a Boolean signal  $x$ :

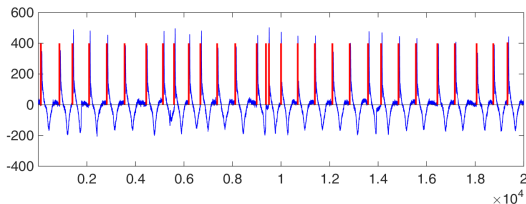

- Syntax

$$\Phi = \{ p \mid \neg \varphi \mid \varphi \wedge \psi \mid \varphi U_I \psi \mid C_I^{\geq n} \varphi \} \quad (1)$$

Counting modality  $(\rho, i) \models C_I^{\geq n} \varphi$  iff  $|N^P[i, I](\varphi)| \geq n$  states, that the number of times formula  $\varphi$  holds within the time interval  $I$  is at least  $n$ .

# 1. Is Tachycardia in the VT, FVT or VF zone?

- Assume we are given a Boolean signal  $x$ :

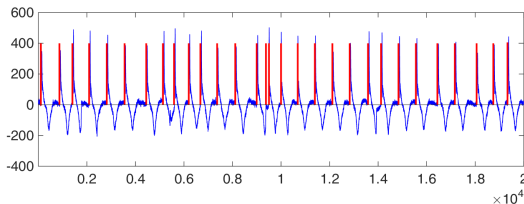

- **Example.** Two minutes after the start of exercise, the heartbeat should be between 90 and 120.

$$\Box \left( st \rightarrow \left( C_{[120,180]}^{\geq 90} p \wedge C_{[120,180]}^{< 120} p \right) \right)$$

# 1. Is Tachycardia in the VT, FVT or VF zone?

- Assume we are given a Boolean signal  $x$ :

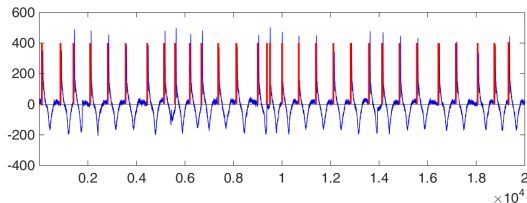

- **Example.** Two minutes after the start of exercise, the heartbeat should be between 90 and 120.

$$\Box \left( st \rightarrow \left( C_{[120,180]}^{\geq 90} p \wedge C_{[120,180]}^{< 120} p \right) \right)$$

- **Theorem (Expressiveness Hierarchy).**  $MTL \subset CMTL$ .

# 1. Is Tachycardia in the VT, FVT or VF zone?

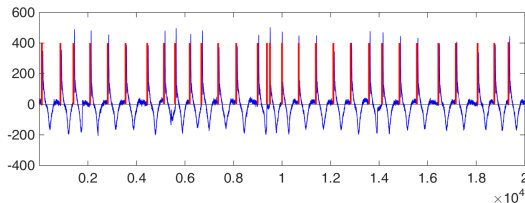

- Assume we are given a Boolean signal  $x$ :

- CMTL-specification

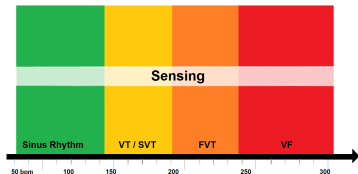

# 1. Is Tachycardia in the VT, FVT or VF zone?

- Assume we are given a Boolean signal  $x$ :

- CMTL-specification

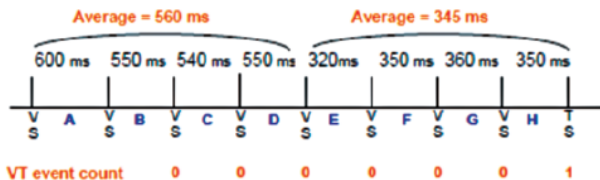

$$(\xi, t) \models \text{“Tach is in the VT/FVT/VF”}$$

$$(\xi, t) \models \{C_{[0,60]}^{\geq thr_1} p \wedge C_{[0,60]}^{< thr_2} p\}$$

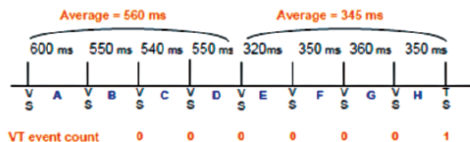

## 2. Is the Sudden Onset detected?

$[A, B, C, D] \cdot 81\% > [E, F, G, H] \implies$  Sudden Onset detected

- Is the Sudden Onset detected?
- How to specify it in a logical formula  $\varphi$ , such that  $\mathcal{M} \models \varphi$ ?

## 2. Is the Sudden Onset detected?

Example: onset criterion programmed at 81 %

$$[E, F, G, H] < [A, B, C, D] \times 81 \%$$
$$345 < 560 \times 81 \%$$

=> sudden onset detected.

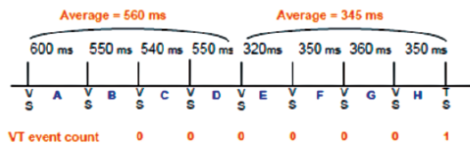

**PROGRAMMING RECOMMENDATION**

Nominal value : 81 %

### ► XCTL-specification

$$(\xi, t) \models \text{"Sudden Onset"} \iff (\xi, t) \models \Phi$$

## 2. Is the Sudden Onset detected?

Example: onset criterion programmed at 81 %

$[E,F,G,H] < [A,B,C,D] \times 81 \%$   
 $345 < 560 \times 81 \%$

=> sudden onset detected.

**PROGRAMMING RECOMMENDATION**

Nominal value : 81 %

### ► XCTL-specification

$$(\xi, t) \models \text{"Sudden Onset"} \iff (\xi, t) \models \Phi$$

$$\Phi := \left\{ p \wedge (x_1 = T) \wedge \Diamond(p \wedge \dots \Diamond(p \wedge (x_9 = T)))) \right. \\ \left. \wedge (x_5 - x_9) * 0.81 \geq x_1 - x_5 \right\}$$

Figure: EGM signal. Sensing

Figure: Monitor. Sudden Onset Detection

### 3. Stability?

- Used to prevent inappropriate therapy for AF with a rapid ventricular rate, which is usually irregular, whereas it is usually regular during VT.

#### Example:

Stability programmed at 40 ms : the difference between 4<sup>th</sup> and 3<sup>rd</sup> intervals is 50 ms :

=> Unstable rhythm and VT event count reset to 0.

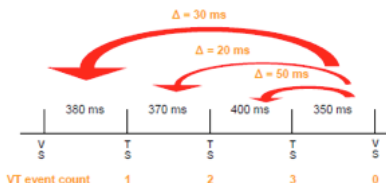

#### PROGRAMMING RECOMMENDATION:

Nominal value : 40 ms

- STL-specification

### 3. Stability?

- Used to prevent inappropriate therapy for AF with a rapid ventricular rate, which is usually irregular, whereas it is usually regular during VT.

#### Example:

Stability programmed at 40 ms : the difference between 4<sup>th</sup> and 3<sup>rd</sup> intervals is 50 ms :

=>Unstable rhythm and VT event count reset to 0.

#### PROGRAMMING RECOMMENDATION:

Nominal value : 40 ms

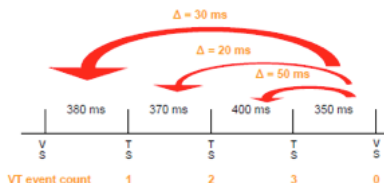

- STL-specification

$$\mu_0 := \{ VT_{counter}[t] > 3 \}$$

$$\mu_i := \{ |x[t] - x[t - i]| > thr \}$$

### 3. Stability?

- Used to prevent inappropriate therapy for AF with a rapid ventricular rate, which is usually irregular, whereas it is usually regular during VT.

Example:

Stability programmed at 40 ms : the difference between 4<sup>th</sup> and 3<sup>rd</sup> intervals is 50 ms :

=> Unstable rhythm and VT event count reset to 0.

**PROGRAMMING RECOMMENDATION:**

Nominal value : 40 ms

- STL-specification

$$\mu_0 := \{ VT_{counter}[t] > 3 \}$$

$$\mu_i := \{ |x[t] - x[t - i]| > thr \}$$

$$(\xi, t) \models \text{"Unstable"} \iff (\xi, t) \models \mu_0 \wedge (\mu_1 \vee \mu_2 \vee \mu_3)$$
